## Gaussian elimination

In the last example last week, we started with a system of equations, converted it into an augmented matrix, applied elementary operations one by one, until the result was a "nice" matrix, of the form

If the number of equations is < the # of variables, we get a slightly different looking "nice" matrix.

$$\begin{array}{c} \overbrace{=}^{2} 2x + y + \overline{z} = 5 \\ 2x - y + \overline{z} = 0 \end{array} \qquad \begin{array}{c} 2 & 1 & 1 & | \\ 2 & -1 & \overline{z} & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 1 & 0 & -2 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 1 & 0 & -2 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 1 & 0 & -2 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 1 & 0 & -2 & | \\ 0 & -2 & 6 & | \\ -4 & -4 & -4 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 & -2 & | \\ 1 & 0 &$$

Now we can easily solve for x and y in terms of Z:

 $\chi = 1 - 2$ , y = 2 + 3 2. Parametric solution:  $\chi = 1 - t$  y = 2 + 3tz = t

<u>Definition</u>: A matrix is in <u>row-echelon form</u> if it satisfies The following:

- 1.) All zero rows (if any) are at the bottom.
- 2.) The first nonzero entry from the left in each nonzero now is a 1 (called the leading 1).
- 3.) Each leading I is to the right of all leading ones above it.

A now-echelon matrix is in <u>reduced</u> now-echelon form if, in addition it satisfies:

4) Each leading 1 is the only nonzero entry in its column.  $\begin{bmatrix}
0 & 1 & * & * & * \\
0 & 0 & 0 & 1 & * & * \\

(How can you use elementary operations to get from RE to RRE?)

Theorem: Every matrix can be but in RE (and RRE) form via a sequence of elementary row operations, via the Gaussian Algorithm:

## Gaussian Algorithm:

<u>step</u>: If the matrix is (i.e. all entries are 0), stop - it's already in RE (and RRE) form.

<u>Step 2</u>: Otherwise, find the first column from the left containing a honzero entry, call it a. Move the row containing that entry to the top row.

<u>Step 4</u>: Subtract multiples of that row from rows below it to make all entries below The leading 1 zero.

Step 5: Repeat 1-4 on matrix consisting of remaining hows.

The process stops when either no rows remain at step 5 or the matrix is O.

Ex: let's use the Gaussian algorithm on:  $\begin{bmatrix} 0 & 0 & 2 & 4 & -1 \\ 0 & 3 & 0 & 9 & 0 \\ 0 & 2 & 1 & 5 & -2 \end{bmatrix}$ 

Step 1: N/A

Step 2: 
$$\begin{bmatrix} 0 & 0 & 2 & 4 & -1 \\ 0 & 3 & 0 & 9 & 0 \\ 0 & 2 & 1 & 5 & -2 \end{bmatrix} \xrightarrow{\text{cwap}} \begin{bmatrix} 0 & 3 & 0 & 9 & 0 \\ 0 & 0 & 2 & 4 & -1 \\ 0 & 2 & 1 & 5 & -2 \end{bmatrix}$$
  
first column  
containing a  
nonzero entry  
(let  $a = 3$ )

Step 3: Multiply the top row by 1/3:

Step 4: Subtract 2 times row 1 from row 3:

Step 5: Repeat for next two hows:

Step 1: N/A

Step 2: 
$$\begin{bmatrix} 0 & 1 & 0 & 3 & 0 \\ 6 & 0 & 2 & 4 & -1 \\ 0 & 0 & 1 & -1 & -2 \end{bmatrix}$$
  
first no hzero  
column. Top  
entry is already  $\neq 0$ .  
Set  $a = 2$ 

Step 3: Multiply row 2 by 1/2

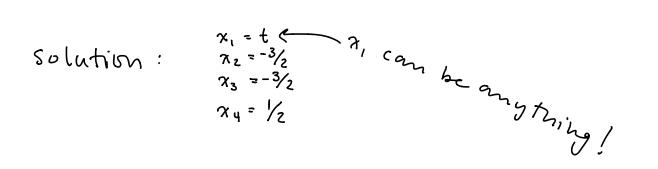

Step 5: Repeat on remaining row:  
Step 2: 
$$\begin{bmatrix} 0 & 1 & 0 & 3 & 0 \\ 6 & 0 & 1 & 2 & -\frac{1}{2} \\ 0 & 0 & 0 & -3 & -\frac{3}{2} \end{bmatrix}$$
  
first nohzero  
column (a = -3)

Step 3:

$$\underbrace{-\frac{1}{3}}_{3} \underbrace{3}_{0} \begin{bmatrix} 0 & 1 & 0 & 3 & 0 \\ 6 & 0 & 1 & 2 & -\frac{1}{2} \\ 0 & 0 & 0 & 1 & \frac{1}{2} \end{bmatrix}$$

Step 4,5: Done - no more rows.

In order to solve the system, we can continue by putting the matrix in RRE form:

What if we end up instead with the following matrix in RRE form:  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$ converting this back to equations, we get:  $x_1 = 0$   $x_3 = 0$ 0 = 1 — obviously false.

Since there is <u>no</u> solution that makes this true, this system is inconsistent.

This general method for solving systems of equations is called Gaussian Elimination.

(1.) Use elementary two operations to get a RRG matrix.

2) If a now [00...01] occurs, the system is inconsistent.

(3.) Otherwise assign non-leading variables as parameters and solve for the leading variables in terms of the parameters.

$$\underbrace{ \begin{bmatrix} 1 & 1 & 7 & 0 \\ 2 & 3 & 2 & 1 \end{bmatrix} } \underbrace{ \begin{bmatrix} 2 & -2 \\ 1 \end{bmatrix} } \begin{bmatrix} 1 & 1 & 7 & 0 \\ 0 & 1 & -12 & 1 \end{bmatrix} } (RE form)$$

$$\underbrace{ \begin{bmatrix} 0 & -2 \\ -2 \\ 0 & 1 & -12 & 1 \end{bmatrix} } \begin{bmatrix} 1 & 0 & 19 & -1 \\ 0 & 1 & -12 & 1 \end{bmatrix}$$

leading variables: x, y. Non-leading variable: z.  $\chi + 19z = -1 \implies \chi = -1 - 19z$   $y - 12z = 1 \implies y = 1 + 12z$ Set z = t. Solution:  $\boxed{\chi = -1 - 19t}$  y = 1 + 12tz = t

Rank

The rank of a matrix is the number of leading ones when it is put in how echelon form.

Ex: What's the rank of 
$$\begin{bmatrix} 1 & 0 & 0 \\ 2 & 3 & 2 \\ 4 & 6 & 4 \end{bmatrix}$$
?

$$\begin{bmatrix} 1 & 0 & 0 \\ 2 & 3 & 2 \\ 4 & 6 & 4 \end{bmatrix} \longrightarrow \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 2 \\ 0 & 6 & 4 \end{bmatrix} \longrightarrow \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 2 \\ 0 & 0 & 0 \end{bmatrix} \longrightarrow \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 2 \\ 0 & 0 & 0 \end{bmatrix}$$

$$Rank = 2$$

Note that if a matrix has mows and n columns, the rank  $r \leq m$  since the leading is are in different rows, and  $r \leq n$  since they are in different columns.

## Rank of augmented matrices

Suppose we have a consistent system of mequations in n variables. Let r= rank of corresponding augmented matrix.

$$m \left\{ \begin{bmatrix} 0 & | & * & * & * \\ 0 & 0 & 0 & | & * \\ 0 & 0 & 0 & 0 & | \\ 0 & 0 & 0 & 0 & | \\ \\ \end{array} \right\}$$

$$r = #$$
 of leading ones,  $n = total #$  of variables, so  
 $n - r = #$  of nonleading variables = # of parameters in solution

=> If h=r, there are no parameters, and thus a unique solution.

If r<h, there is at least one parameter involved, which can take on infinitely many values, so there are

infinitely many solutions.

Practice problems: 1.2.2b, 1.2.3b, 1.2.5gh, 1.2.8, 1.2.11adf
